PDAC Invite March 2nd until the 7th St.Regis Hotel 325 Bay St

Juggernaut Exploration TSX-V JUGR has Crescat Capital with over 19% ownership and Ph.D. Quinton Hennigh, as technical advisor, will be presenting and available for one-on-one meetings in Toronto at the St. Regis Hotel, 325 Bay St. March 2nd until the 7th. Dan Stuart President, and Senior Geologist Ph.D. Lele Lazzarotto who is credited for Goliath's Surebet discovery and program manager will be in attendance for any technical questions—reservation time slot details are located below.

BINGO PROPERTY: Shear Hosted High-Grade Gold and Copper Discovery

Bingo is located in the Eskay Rift in an evolving gold district in a world-class geologic setting within the Golden Triangle of British Columbia, host to several multi-million-ounce gold deposits confirming the untapped discovery potential that remains while vast areas of newly exposed bedrock are exposed due to recent snowpack and glacial abatement.

Bingo comprises the same world-class geological units as Goliath Resource's Surebet discovery located 12 km to the West, including Hazelton Volcanics and related sediments and intrusive rocks, as well as the same style of mineralization of

pyrrhotite, chalcopyrite, and galena, hosted in a similarly oriented west dipping shear zone.

Midas Property: Eskay-style VHMS

Link to Midas YouTube Video: [Click On Link](#)

Midas Kokomo target is a strong drill ready Eskay-style VHMS showing with a 1 m chip sample assaying 9.343 gpt Au, 117 gpt Ag, 1.58 % Cu and 1.77 % Zn. The outcrop remains open in all directions where outcrops of the same or similar lithology extend over several hundred meters. Kokomo showing has been mapped by the British Columbia Geological Survey (BCGS; M. McKeown, J. Nelson and R. Friedman, 2007) as a conformable sequence of layered Paleozoic felsic to mafic subaqueous volcanoclastic rocks including lenses of massive sulphide surrounded by an extensive alteration zone consistent with VHMS deposits. The Kokomo target has strong potential to evolve into a significant new VHMS discovery supported by known mineralization, grade, alteration, and textures observed at the surface and, most recently, by the chargeability and resistivity anomalies highlighted by the 3D inversion of the IP data. The latter is confirmation of the continuation of the system at depth which remains open to the east and to the south making the Kokomo showing a strong drill target for an Eskay style discovery.
